ChatGPT SEO Article Guide for drjawariarasheed.com

Version 2 · For Dr. Jawaria Rasheed — Gynae, Obs, Infertility & Andrology articles
Updated 29 October 2026

Use this guide every time. Do **not** ask ChatGPT to "write an article" in one line — that gives thin, generic AI content that will not rank. Follow the steps below and use the Master Prompt in Step 2 exactly.

What is new in version 2

Version 1 covered *writing* a good article. Writing is roughly half of ranking. These sections were added:

- **Step 0** — choosing a keyword you can actually win, before you write anything.
- **Step 5** — schema, author box and trust signals (what Google uses to judge a medical site).
- **Step 6** — internal links *into* the article and topic clusters. This was the biggest gap.
- **Step 7** — the Search Console loop that actually moves an article from page 3 to page 1.
- **Step 8** — AI Overviews, AI Mode and AI assistants.
- **Step 9** — what not to do on a medical (YMYL) site.
- **Step 10** — realistic timeline, how often to publish, and what to measure.

STEP 0 — Pick a keyword you can win (10 minutes) NEW

Most articles fail here, not in the writing. A perfect article on the wrong keyword earns nothing.

0.1 Find the real wording patients use

- Type your topic into Google and read the **autocomplete** suggestions. Those are real searches.
- Search it, then read the **People also ask** box and the **Related searches** at the bottom. Each one is a possible H2 in your article.
- Check **Google Trends** with the country set to Pakistan, to see whether a term is actually used here.
- Once the site has a few months of data, **Search Console** is the best source of all: it shows the exact words people already used to find you (Step 7).

0.2 Check what Google already shows for it

Search your keyword and look at the first page. Ask:

- **What kind of page ranks?** If the top ten are all clinic service pages, an article will struggle — and the opposite is also true. Match the type of page Google is already rewarding.
- **Who ranks?** If it is all Mayo Clinic, NHS and Cleveland Clinic, pick something narrower. If you see Pakistani clinics, hospital blogs and forums, you have a chance.

- **Is there a local angle?** "PCOS treatment in Bahawalpur" is far easier than "PCOS treatment".

0.3 Start narrow, then widen

A new site does not win broad keywords. Begin with long, specific questions and build up:

Too hard for now	Start with this instead
PCOS	PCOS symptoms in unmarried girls in Pakistan
Infertility treatment	What tests are done for infertility in couples in Pakistan
IUI	How to prepare for a semen test before IUI
Irregular periods	Irregular periods after marriage — when to see a doctor

> **Do not compete with your own site.** drjawariarasheed.com already has service pages for IUI, infertility evaluation, PCOS, pregnancy care, period problems, fibroids, endometriosis, menopause, cervical screening and family planning. If a service page already targets the keyword, do **not** write an article on the same keyword — the two pages will split the signal and both will sit lower. Write the article on a different angle (a question, a comparison, a "how to prepare" guide) and link it to the service page.

STEP 1 — Before you open ChatGPT (5 minutes)

1. Choose **one** topic and **one** main keyword (from Step 0).
2. Google that keyword. Open the top five articles. Note the sub-topics they cover — and, more usefully, the questions *none* of them answer well.
3. Decide your location angle: Bahawalpur, Lodhran, or South Punjab.
4. Keep this clinic block ready to paste into ChatGPT:

- **Doctor:** Dr. Jawaria Rasheed, Consultant Gynecologist & IUI Specialist
- **Qualifications:** MBBS, FCPS (Obstetrics & Gynaecology), ICMT, PGD, DipLM, PGDip Sexual and Reproductive Medicine, 15+ years experience
- **Clinic:** Jawaria Andrology Lab and Infertility Clinic
- **Address:** House No. 1/1, Gulzar-e-Sadiq Road, Bahawalpur. Second place: Rasheed Surgical Hospital, Lodhran (confirm exact timings at each place before publishing)
- **Timings:** Mon–Fri, 3:00–7:00 pm (confirm before publishing if timings change)
- **Phone / WhatsApp:** 0300 0610903
- **Website:** drjawariarasheed.com | **Email:** info@drjawariarasheed.com
- **Services:** Gynecological consultations, reproductive health, fertility evaluation for couples, IUI, women's wellness (adolescence to menopause), IUI lab and semen analysis on site

STEP 2 — Master prompt (copy-paste to ChatGPT, fill the brackets)

You are an expert medical SEO writer. Write an article for my website drjawariarasheed.com that can rank on Google in Pakistan.

TOPIC: [e.g. PCOS — causes, symptoms and treatment] **MAIN KEYWORD:** [e.g. PCOS treatment in Pakistan] **SECONDARY KEYWORDS:** [3–5 related] **LOCATION:** [Bahawalpur / Lodhran / South Punjab] **TARGET READER:** Married women and couples in South Punjab searching for this problem in simple English. Many readers are not medical experts.

STRICT RULES — follow all of them:

1. **WORD COUNT:** Match the length to the question, between 1,200 and 2,000 words of main content. Cover the topic completely and then stop. Do not pad or repeat sentences to reach a number. Give the total word count at the very end. CHANGED
2. **CORRECT MEDICAL KNOWLEDGE ONLY:** Base all medical facts on internationally accepted gynecology, obstetrics, infertility and andrology knowledge, as published by WHO, ACOG, RCOG, ESHRE and ASRM. If you are not sure about a fact, a dosage, a success rate or a procedure detail, write `[VERIFY]` next to it instead of guessing. Never invent success rates, prices or guarantees. Never write "this treatment will make you pregnant" or promise a cure. For success rates, give only a general range and clearly say results are different for every patient. Do not give personal diagnosis or personal treatment advice to any one patient.
3. **NO AI-SOUNDING WRITING:** Write like an experienced Pakistani female doctor explaining to a patient, in simple, natural English. Short paragraphs of 2–3 lines. No robotic phrases such as "in conclusion", "it is important to note", "delve", "furthermore", "moreover" repeated again and again. Do not repeat the same point in different words.
4. **ANSWER FIRST:** Immediately under the H1, before any background, give a direct 40–60 word answer to the main question, in plain language, as a standalone paragraph. Someone who reads only that paragraph must have a correct, useful answer. NEW
5. **SELF-CONTAINED SECTIONS:** Phrase H2 headings as the questions a patient would type, and make each section understandable on its own without the reader having read the earlier sections. Do not write "as mentioned above". NEW
6. **SEO STRUCTURE** — give the article in exactly this order:
   - **a)** SEO Title: 55–60 characters, main keyword at the start, attractive for a click.
   - **b)** Meta Description: 150–160 characters, main keyword plus one benefit plus a call to action.
   - **c)** URL Slug: short, lowercase, with the main keyword, e.g. `pcos-treatment-pakistan`. No dates, no stop words.
   - **d)** H1: one headline only, with the main keyword naturally.
   - **e)** The 40–60 word direct answer from rule 4.
   - **f)** Introduction: 100–150 words. Mention the problem, why it is common in Pakistan, and what the reader will learn.
   - **g)** Main body: 6–8 H2 headings, with H3 sub-headings where needed. Cover in full: what it is, causes, symptoms and signs, how it is diagnosed (tests), treatment options (lifestyle, medicine, procedure — in general terms only), when to see a doctor (warning signs), effect on pregnancy and fertility if relevant, myths versus facts, and cost factors in Pakistan (factors only, do not invent an exact price — write `[ADD CLINIC PRICE]` if a price is needed). Use the

main keyword naturally 8–12 times in total (about 1%), and secondary keywords naturally. Do not keyword stuff. Add ONE useful table where it helps (for example symptoms versus normal, IUI versus IVF, tests and what they show). Add bullet points and numbered lists where they help a patient understand.

- **h)** "When should you visit Dr. Jawaria Rasheed?" section: 80–100 words, with the clinic name, Bahawalpur address, Mon–Fri 3–7 pm, and WhatsApp 0300 0610903. Soft, helpful tone — not sales pressure.
- **i)** FAQs: 5–6 questions that real patients in Pakistan ask on Google ("People also ask"). Answer each in 40–60 words, in simple language, factually correct.
- **j)** Conclusion: 80–100 word summary plus one clear call to action — book a consultation at Jawaria Andrology Lab and Infertility Clinic, Bahawalpur, or message on WhatsApp 0300 0610903.
- **k)** Medical disclaimer at the end, exactly in this sense: "This article is for general information only and is not a substitute for medical advice. Please consult Dr. Jawaria Rasheed or your own doctor for diagnosis and treatment for your personal condition."

7. **LANGUAGE:** Simple English at the reading level of a matric or FA student, with medical terms explained in one line when first used. You may add one common Roman Urdu word in brackets only where it genuinely helps a local patient, for example periods (mahvari). Do not write the whole article in Urdu.
8. **TRUST (Google E-E-A-T for medical sites):** In the byline, write: "Medically reviewed by Dr. Jawaria Rasheed, Consultant Gynecologist & IUI Specialist, MBBS, FCPS." Add 2–3 links to authoritative sources (WHO, ACOG, RCOG, ESHRE, ASRM) in a "Sources" line at the end. Never copy text from any other website.
9. **EXPERIENCE:** Mark 2–3 places with `[CLINIC EXPERIENCE]` where a real detail from this clinic should be added — a question patients here ask often, what the clinic actually does at a first fertility visit, or a local example. I will fill these in myself. NEW
10. **AT THE VERY END, separately, give me:** (1) the total word count, (2) 3–5 internal linking suggestions to other pages on drjawariarasheed.com with the exact anchor text to use, (3) 3–5 pages on my own site that should link *to* this new article, with the anchor text, (4) 2–3 image suggestions with SEO alt text and a suggested file name for each, (5) a list of every fact marked `[VERIFY]`, `[ADD CLINIC PRICE]` or `[CLINIC EXPERIENCE]`. CHANGED

First, before writing the full article, give me **ONLY the outline** (H1, all H2 and H3 headings, and the word count planned for each section). Wait for my "GO" before writing the full article.

STEP 3 — After ChatGPT gives the outline and full article

1. Read the outline first. Add any sub-topic the top five Google articles covered that ChatGPT missed. Then say "GO".
2. After the full article comes, send ChatGPT this follow-up prompt:

"Now check your own article and fix it: (1) Confirm the word count and that every section earns its place — if a section repeats another, merge them. (2) Remove any AI-sounding, repeated or sales phrases. (3) Check that the main keyword is in the title, H1, the first 100 words, at least 2 H2 headings and the conclusion — naturally, not stuffed. (4) Confirm the 40–60 word direct answer sits immediately under the H1 and answers the question on its own. (5) List every medical fact that

needs doctor verification, with its section name. Do not change any correct medical fact without telling me."

3. Give the article to Dr. Jawaria Rasheed (or a qualified doctor) to review. Remove or fix everything marked `[VERIFY]`. Add the real clinic price only if the clinic wants a price published.
4. Fill in every `[CLINIC EXPERIENCE]` marker with something AI cannot know: a question patients at this clinic ask often, a local example from Bahawalpur, Lodhran or South Punjab, or the clinic's actual way of doing a fertility evaluation. **This is the single step that separates your article from every other AI article on the same topic.**

STEP 4 — Publishing checklist in WordPress

- ☐ Title, meta description and slug exactly as planned (set in Rank Math).
- ☐ Only ONE H1. All H2 and H3 in order, no skipped levels. Paragraphs of 2–3 lines.
- ☐ The 40–60 word direct answer is the first paragraph, not buried under an introduction.
- ☐ 3–5 internal links out to your own service or article pages, with natural anchor text.
- ☐ 3–5 existing pages edited to link *in* to this new article (see Step 6 — do not skip this).
- ☐ 2–3 external links to WHO / ACOG / RCOG / ESHRE / ASRM sources.
- ☐ 3–4 images: descriptive file names (`pcos-symptoms-chart.jpg`, not `IMG_2831.jpg`), each under about 150 KB, with keyword-relevant alt text that describes the picture honestly.
- ☐ Featured image set — it is also the picture that shows when the link is shared on WhatsApp and Facebook.
- ☐ Author box: Dr. Jawaria Rasheed, qualifications, clinic address, timings.
- ☐ FAQ section added, and FAQ schema if Rank Math offers it for that post.
- ☐ Medical disclaimer at the end.
- ☐ WhatsApp appointment button / 0300 0610903 link working.
- ☐ Mobile check: open the live article on a phone. No long blocks of text, no table spilling off the screen.
- ☐ After publishing, submit the URL in Google Search Console: URL Inspection → Request Indexing.

> **About the Indexing API:** if anyone suggests using Google's Indexing API to push articles in faster, do not. Google officially supports it only for job postings and live video pages. For articles, URL Inspection → Request Indexing is the correct route, and a healthy sitemap does most of the work anyway.

STEP 5 — Schema, author and trust signals NEW

On a medical site, Google weighs trust more heavily than on an ordinary blog. Google states that it gives more weight to strong experience, expertise, authoritativeness and trustworthiness on topics that can affect a person's health — and that of the four, **trust is the most important**.

5.1 Schema to set in Rank Math

Where	What to set	Why
Each article	Schema type **Article**, with the author set to Dr. Jawaria Rasheed and both the published and modified dates filled	Tells Google who wrote it and how fresh it is
Each article with FAQs	**FAQ** schema on the FAQ block	Can show the questions directly in search results
Site-wide	**Breadcrumbs** turned on	Shows the path in search results and helps Google see the structure
Homepage / About	**Person** or **Physician** schema for the doctor, plus the clinic's address and opening hours	Links the articles to a real, verifiable person and place

5.2 The author must be a real, visible person

- Every article shows "Medically reviewed by Dr. Jawaria Rasheed" with her real qualifications, linked to the About page.
- The About page should carry the full professional background: degrees, where she trained, hospital roles, memberships, years of practice.
- Link out to independent profiles where she already exists — the clinic's YouTube channel, a Google Business Profile, PMDC registration, hospital or directory listings. These let Google connect the website to a real doctor.
- Show a real photograph. Google explicitly warns against fabricated creator profiles — AI-generated headshots, invented author names, or credentials that are not real. On a medical site this is a serious risk, not a shortcut.

> **Disclose the AI assistance where a reader would reasonably wonder.** Google does not ban AI-assisted content. What it treats as low effort is generating large amounts of text with no real human oversight or curation. A line such as "Written with research assistance and medically reviewed by Dr. Jawaria Rasheed" is honest and costs you nothing.

STEP 6 — Internal links and topic clusters NEW

This was the biggest gap in version 1. Version 1 told you to add links *out of* the article. The links that actually help a new article rank are the ones pointing **into** it from pages you already have.

6.1 Hub and spoke

Treat each service page as a hub, and articles as spokes around it:

Hub (service page)	Spokes (articles that link up to the hub)
`/iui-treatment/`	IUI vs IVF; how to prepare for a semen test; what happens on the day of IUI
`/infertility-evaluation/`	Fertility tests for couples step by step; unexplained infertility; when to start testing
`/pcos/`	PCOS symptoms; PCOS and pregnancy; PCOS diet in Pakistan
`/pregnancy-care/`	First three months; antenatal visit schedule; warning signs in pregnancy
`/andrology-iui-lab/`	How to read a semen analysis report; low sperm count; lifestyle and sperm health

6.2 The rule to follow every time you publish

1. Every article links **up** to its hub service page, with descriptive anchor text ("IUI treatment at our Bahawalpur clinic"), not "click here".
2. The hub service page gets a short "Read more" list linking **down** to its articles.
3. Articles in the same cluster link **across** to each other where it genuinely helps the reader.
4. Every article links to `/book-appointment/` or `/contact/` at least once.
5. Open 2–3 older articles and add a link to the new one. Two minutes of work, and it is how a new page gets found and gains weight.

6.3 One keyword, one page

Never let two of your pages chase the same keyword. If you later write a better article on a topic you already covered, **update the old article** rather than publishing a second one. Two half-strong pages rank worse than one strong page.

STEP 7 — The ranking loop in Search Console NEW

Publishing is the start, not the finish. Almost every article lands somewhere on page two or three and sits there. The work below is what moves it up — and it is far cheaper than writing a new article.

7.1 Week 1

- URL Inspection → Request Indexing.
- Check the verdict says the URL is on Google. If it says "Crawled — currently not indexed", wait a week; if it persists, the article is probably too thin or too similar to an existing page.

7.2 From week 4 onwards — the loop that works

1. Search Console → **Performance** → filter by Page → pick the article.
2. Switch to the **Queries** tab. Turn on **Average position** and **Impressions**.
3. Find queries with decent impressions sitting at **position 5–15**. These are nearly ranking — one small push moves them onto page one. Ignore anything past position 30 for now.
4. For each one, ask: does the article actually answer that exact question, in those exact words, in its own section? Usually it does not.
5. Add a short H2 using the patient's wording, with a 50–80 word direct answer. Do not rewrite the article.
6. Update the article, request indexing again, and note the date.
7. Check again after 3–4 weeks.

> **Two things to know about this data.** Search Console figures lag 2–3 days, so do not judge yesterday. And note that a logging fault made impressions, click-through rate and average position unreliable between 13 May 2025 and 27 April 2026; clicks were unaffected and the figures were not corrected backwards. If you ever compare against that period, expect an apparent drop in impressions that is not real.

7.3 Every six months

- Re-read the older articles. Fix anything out of date, add what you have learned from patient questions since.
- Only then change the "last updated" date. Changing the date without changing the content fools nobody and can cost you trust.
- Any article that has had near-zero impressions for six months: either rewrite it properly around a question people actually search, or merge it into a stronger article.

STEP 8 — AI Overviews and AI assistants NEW

A growing share of people now read an AI answer instead of clicking. The good news: the same things that win a featured snippet also get you quoted by AI.

- **The 40–60 word direct answer** under the H1 (Step 2, rule 4) is the single most quotable unit on the page.

- **Question-shaped H2s with self-contained answers** can be lifted out and cited without the surrounding article.
- **Clear sourcing and a named, credentialed author** make a passage safer for an AI system to quote on a health topic.
- **Tables and short lists** get picked up more often than long paragraphs.

Where to see it in Search Console

Search Console has a **Generative AI** performance report, available to all sites since the end of August 2026, which shows your visibility in AI Overviews and AI Mode. Two limits worth knowing before you read too much into it: it reports **impressions only** — no clicks, no click-through rate, no position and no query breakdown — and it is limited to pages, countries, devices and dates. Separately, clicks that people make from AI Mode are already counted inside your ordinary Performance report, so you cannot cleanly split "AI" from "normal" traffic in the totals.

> **Practical reading:** use the Generative AI report to see *which pages* get surfaced in AI answers, and write more of that kind. Do not try to build a traffic forecast from it.

STEP 9 — What not to do on a medical site NEW

Google scrutinises health content far more heavily than ordinary content, because a wrong answer can hurt someone. The items below are not stylistic preferences; any of them can hold the whole domain back.

Do not	Because
Invent success rates, percentages or prices	Health content is judged against established expert consensus. One invented figure undermines the whole site.
Write "best gynecologist in Bahawalpur", "guaranteed pregnancy", "100% results"	Unverifiable superlatives and guarantees are a trust problem with Google and an ethical problem with patients.
Publish patient stories, photos or testimonials without written consent	Patient privacy. Also: fabricated testimonials are a clear spam signal.
Use a fake author, a stock headshot or invented credentials	Google names fabricated creator profiles — AI headshots, invented names, false credentials — as something it acts against.
Mass-publish twenty AI articles in a week	Large volumes of text generated without real human oversight is exactly what Google describes as little to no effort.
Copy text or images from another clinic's website	Duplicate content and copyright. It also means your site says nothing new.
Give personal diagnosis or dosage advice in an article	Articles are general information. Diagnosis belongs in the consultation room, and the disclaimer must say so.
Stuff "Bahawalpur" into every heading	One clear location section plus a natural mention or two is enough. Repetition reads as spam to both Google and patients.

STEP 10 — Timeline, cadence and what to measure NEW

10.1 Honest expectations

When	What is realistic
Week 1–2	Article indexed. Impressions near zero. Normal.
Month 1–2	Impressions start, mostly on long questions. Position 20–50. Normal.
Month 3–4	First real clicks. A few queries reach page two. Start the Step 7 loop.
Month 5–8	With 15–25 articles and a clean cluster structure, local keywords start reaching page one.

If someone promises page one in four weeks for a new medical site, they are selling something.

10.2 Cadence

Two to four good articles a month, every month, beats twenty in one week and then nothing. Finish each cluster before starting the next: three or four articles around IUI, all linked to the IUI service page, do more than one article each on twelve unrelated topics.

10.3 What to measure

Traffic is not the goal — appointments are. Track these monthly in a simple sheet:

Metric	Where from	Why it matters
Indexed articles	Search Console, Pages report	An unindexed article is invisible
Total clicks and impressions	Search Console, Performance	Is the trend going up month on month
Queries at position 5–15	Search Console, Queries tab	Your to-do list for next month
WhatsApp button clicks	Analytics event, or simply ask the clinic	The only number that becomes a patient
"How did you hear about us?"	Ask at reception	The honest cross-check on everything above

Topics queue

One keyword per article. Never two articles on the same keyword. Work down a cluster before moving to the next one.

Cluster	Articles, in suggested order
Infertility (start here — highest intent)	Fertility evaluation for couples, step by step; IUI treatment complete guide; IUI vs IVF — which is right for you?; Unexplained infertility; Ovulation problems and treatment in general terms
Andrology (least competition)	Semen analysis — how to read the report; How to prepare for a semen test; Low sperm count — causes and next steps; Lifestyle factors that affect sperm health; Varicocele and male fertility
Gynae	PCOS complete guide; Irregular periods — causes and treatment; Endometriosis; Uterine fibroids; White discharge — when is it serious?; Menopause care
Obstetrics	First three months of pregnancy care; Antenatal visit schedule in Pakistan; High-risk pregnancy warning signs; Gestational diabetes; Blood pressure in pregnancy (pre-eclampsia); Normal delivery vs C-section — how the decision is made

The one-page version

1. Pick a question people actually search and that your own pages do not already target.
2. Write it with the Master Prompt, answer-first, and have the doctor check every medical fact.
3. Add the real clinic detail that AI cannot know.
4. Link it into its cluster, both ways.
5. Come back at week four with Search Console and fix what is nearly ranking.
6. Repeat two to four times a month for six months.
